

# A Tipping Point

## Technical Specification

### **Performing Space**

The show is performed in a circular space with a diameter of 4 metres. There needs to be at least 3.5 metres clearance from floor to ceiling to allow juggling and balancing to take place.

The show is best performed on a flat floor with the audience on the same level as the performers (i.e. not on a raised stage).

If the performing space is smoke-alarmed, it should be possible for this to be disabled for the duration of the show, which uses a smoke machine.

### **Power**

Access to standard 13 amp mains power is needed for a mains-operated smoke machine.

### **Lighting**

If lighting is available it would enhance the show, but it is not essential.

### **Access**

Doors to the performing space need to open to at least 1.5 metres to allow access for props.

### **Pyrotechnics**

At one point in the show a small indoor pyrotechnic effect is used, but this is safe for indoor use and will not damage flooring.
